Civil and Structural engineering  
services

**Project Description**

A detailed technical investigation and energy audit was conducted on the chemical process facility to determine heating plant options to replace a failed district plant heating supply source provided by the Ajax District Heating facility. The study investigated various heating plant options to satisfy existing process and heating requirements of the industrial facility as well as expansion capabilities into tank farm heating and heat tracing. The final report included recommendations and complete design and capital cost details for the new steam heating plant.

Study was completed in November 2005
